Background

- The benefits of sport participation are substantial
- Attrition is common for youth without disabilities, with an average North American rate of 35% annually (e.g., Gould, 1987)
- Many challenges to sport participation for youth with Intellectual Disabilities (ID)
 - Exclusion, less access, sedentary lifestyle (Temple et al. 2006; Walsh, 2005)

Objective

- So sport may be helpful, it is certainly valued by many
- What keeps youth with ID involved in sport?
- Longitudinal analysis over a 3 year period

YORK

4

Special Olympics

- Commonly used at community levels
 - Proliferation of different streams to sport - Traditional, Unified, Active Start, etc...
- A number of psychological/emotional correlates, with less evidence for physical and intellectual benefits (Tint, Thomson, & Weiss, 2016)
 - Few RCTs
 - · High risk of bias

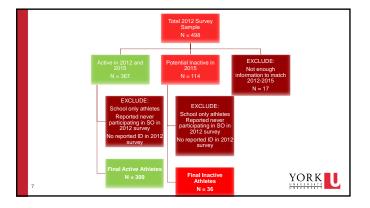

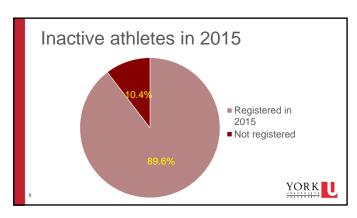

Method

- Invite caregivers of all registered SO Ontario athletes 11-21 years of age to participate in survey in 2012 (N = 2400)
 - Of those who complete Time 1, who remains registered in 2015 database?
 - Time 1 n = 498, though with missing data
- All variables measured in 2012 (before dropout)

What does not differ between groups?

- Athlete characteristics: Age, gender, level of independence, problem behaviours, diagnoses
- Parent and sociodemographics: Age, SES, income, level of parent support for physical activity
- Inclusion and participation outside of SO: Friendship quality, access to resources, level of participation outside SO
- Age when athlete first got involved in SO
- Total number of gold medals

How are inactive athletes different?			
Does your child participate in non-sport SO events (% yes)	p = .05	Example of Supports / Barriers Do the following things help or make it harder for your child to participate in SO (Not an issue / usually helps / sometimes helps / usually makes it harder): -Physical layout, social demands, weather	
Frequency of SO participation in the last 12 months (5 point scale)	p < .001		
Friendship quality in Special Olympics	p =.007	Are the following available and adquate to support your child's participation in SO (Not needed / usually yes/ Sometimes yes / usually no)	
Overall Environmental Support Score in SO (%)	p = .03	-Transportation, information, equipment, money	
10		YORK U	

How are inactive athletes different? Examples from Youth Experiences Survey SO (18 items): Identity Experiences: Has improved their selfesteem Initiative Experiences: Learned to physical push themselves Mean athlete-coach relationship score p = .04 Examples of athlete-coach questions (4 items): My child is close to their coach(es) Coaches are committed to my child

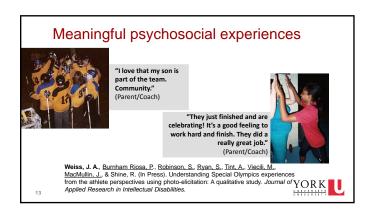

Discussion

- It is about experiences that differentiates
 - Athlete experience and sport specific factors rather than youth and family characteristics
 - And this is within an organization already developed to support youth with ID

12

YORK

Limitations

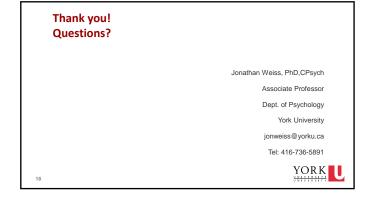

- At most a 20% participation rate at Time 1, likely less
 - · Youth and family representativeness is limited
- Participants in SO may not represent typical youth with ID who struggle to seek sport or participate in other kinds of sport
- Lack of experimental design Time 1 is not a baseline
- All caregiver report

Discussion

- Coaches and parents can foster positive experiences and can play an important role in continued sport participation
- Understanding the factors associated with sustained active involvement in sports is critical for sport retention efforts
- It's not just about being involved vs. not: It's what your involvement is like (Tint, Maughan, & Weiss, 2016)
